

# STRUCTURAL GUIDE

THE PERFECT PARTNER FOR THE TRADE

# INTRODUCTION

## STRUCTURAL GUIDE

The following guide has been devised so as to allow the correct selection of components for a range of standard conservatory styles.

The information has been developed from an extensive programme of structural analysis and has been simplified as far as possible. It should be noted however, that a certain amount of information will be required to allow accurate selection of the components.

### The information required to use the guide is as follows:

Conservatory size and style  
Glazing type  
Location  
Exposure (town or country)  
Approx. altitude of site  
Approx. distance from sea

Generally, the dominant load on a roof is the snow load and therefore reference to loads are only made to **sections 4-6**. Some areas of the United Kingdom however with high altitude/ exposed/coastal locations may have wind loads that are higher than the snow loads associated with that area. For installations in these type of areas where the wind loading is dominant, reference should be made to **section 3** or contact made with the K2 Technical Department.

Structural stability is dependent not only on individual components but also on the interaction of the structure as a whole. Careful consideration must be given to the supporting structure beneath the roof such as the vertical side frames of PVC or timber and associated brickwork below which should be designed in accordance with the relevant British Standards for both vertical and lateral loadings.

If you are in any doubt about the loading of the vertical side frames it is advised you contact the technical department of your side frame supplier for guidance.

With reference to this structural guide it is assumed that the conservatory is being attached to an existing building and is not freestanding.

Listed below is a step-by-step procedure for the use of this guide. If you are in any doubt on any aspect of the guide then please contact the K2 Technical Department for advice.

## **STEP 1 Style and size of conservatory**

Check these guidelines for the style of conservatory required and all relevant sizes. Make sure that the roof is not over the maximum sizes given in section 1 of this Structural Guide.

## **STEP 2 Determine the snow load**

Determine the snow load from the British Isles map in **section 2**.

## **STEP 3 Location of site**

If the conservatory is to be installed in an exposed country location, exposed coastal location or at high altitude, then please refer to **section 3** to ascertain whether the wind load is the dominant factor. If so or you are in any doubt, contact K2 Technical Department for advice.

## **STEP 4 Select transom glazing bar**

Select the correct transom glazing bar for the required glazing type, bar spacing and loading conditions from **section 4**. There are two sections shown here depending on the style of roofing:

- a. Victorian/Georgian Style
- b. Lean to Style
- c. 35mm Low Pitch System

## **STEP 5 Select hip glazing bar**

Select the correct hip bar for the required glazing type, bar spacing and loading conditions from **section 5**. There are two sections shown here depending on the style of roof:

- a. Victorian Hip Bar
- b. Georgian Hip Bar

## **STEP 6 Tie Bar Guide**

Determine the tie bar requirement for the proposed roof using **section 6**.

## STYLE AND SIZE OF CONSERVATORY

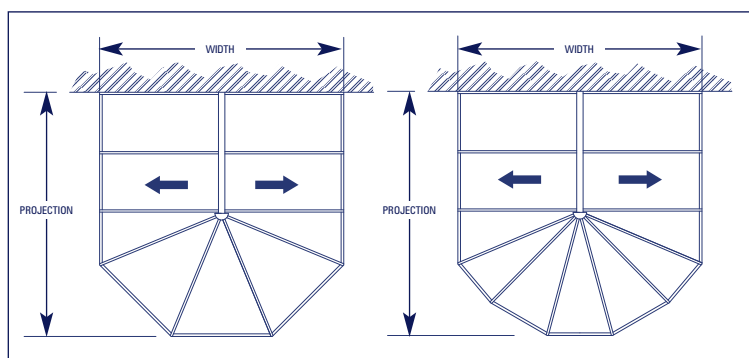

STRUCTURAL GUIDE

All sizes given are based on internal frame dimensions.

### LEAN TO

	MAXIMUM WIDTH	MAXIMUM PROJECTION
<b>Glass</b>	no limit	see section 4b
<b>Polycarbonate</b>	no limit	see section 4b

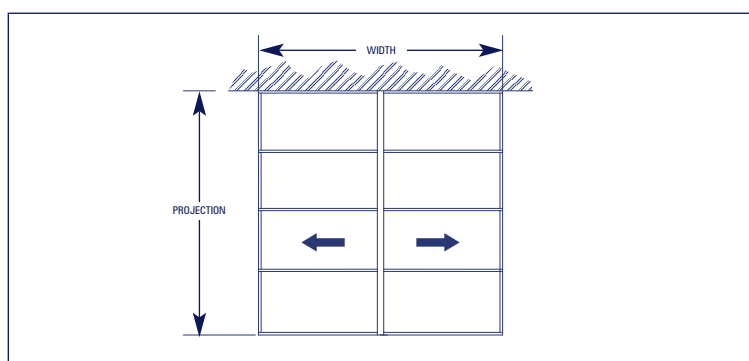

### VICTORIAN

	MAXIMUM WIDTH	MAXIMUM PROJECTION
<b>Glass</b>	5750mm	6500mm
<b>Polycarbonate</b>	6500mm	6500mm

### GEORGIAN

	MAXIMUM WIDTH	MAXIMUM PROJECTION
<b>Glass</b>	5250mm	6500mm
<b>Polycarbonate</b>	6000mm	6500mm

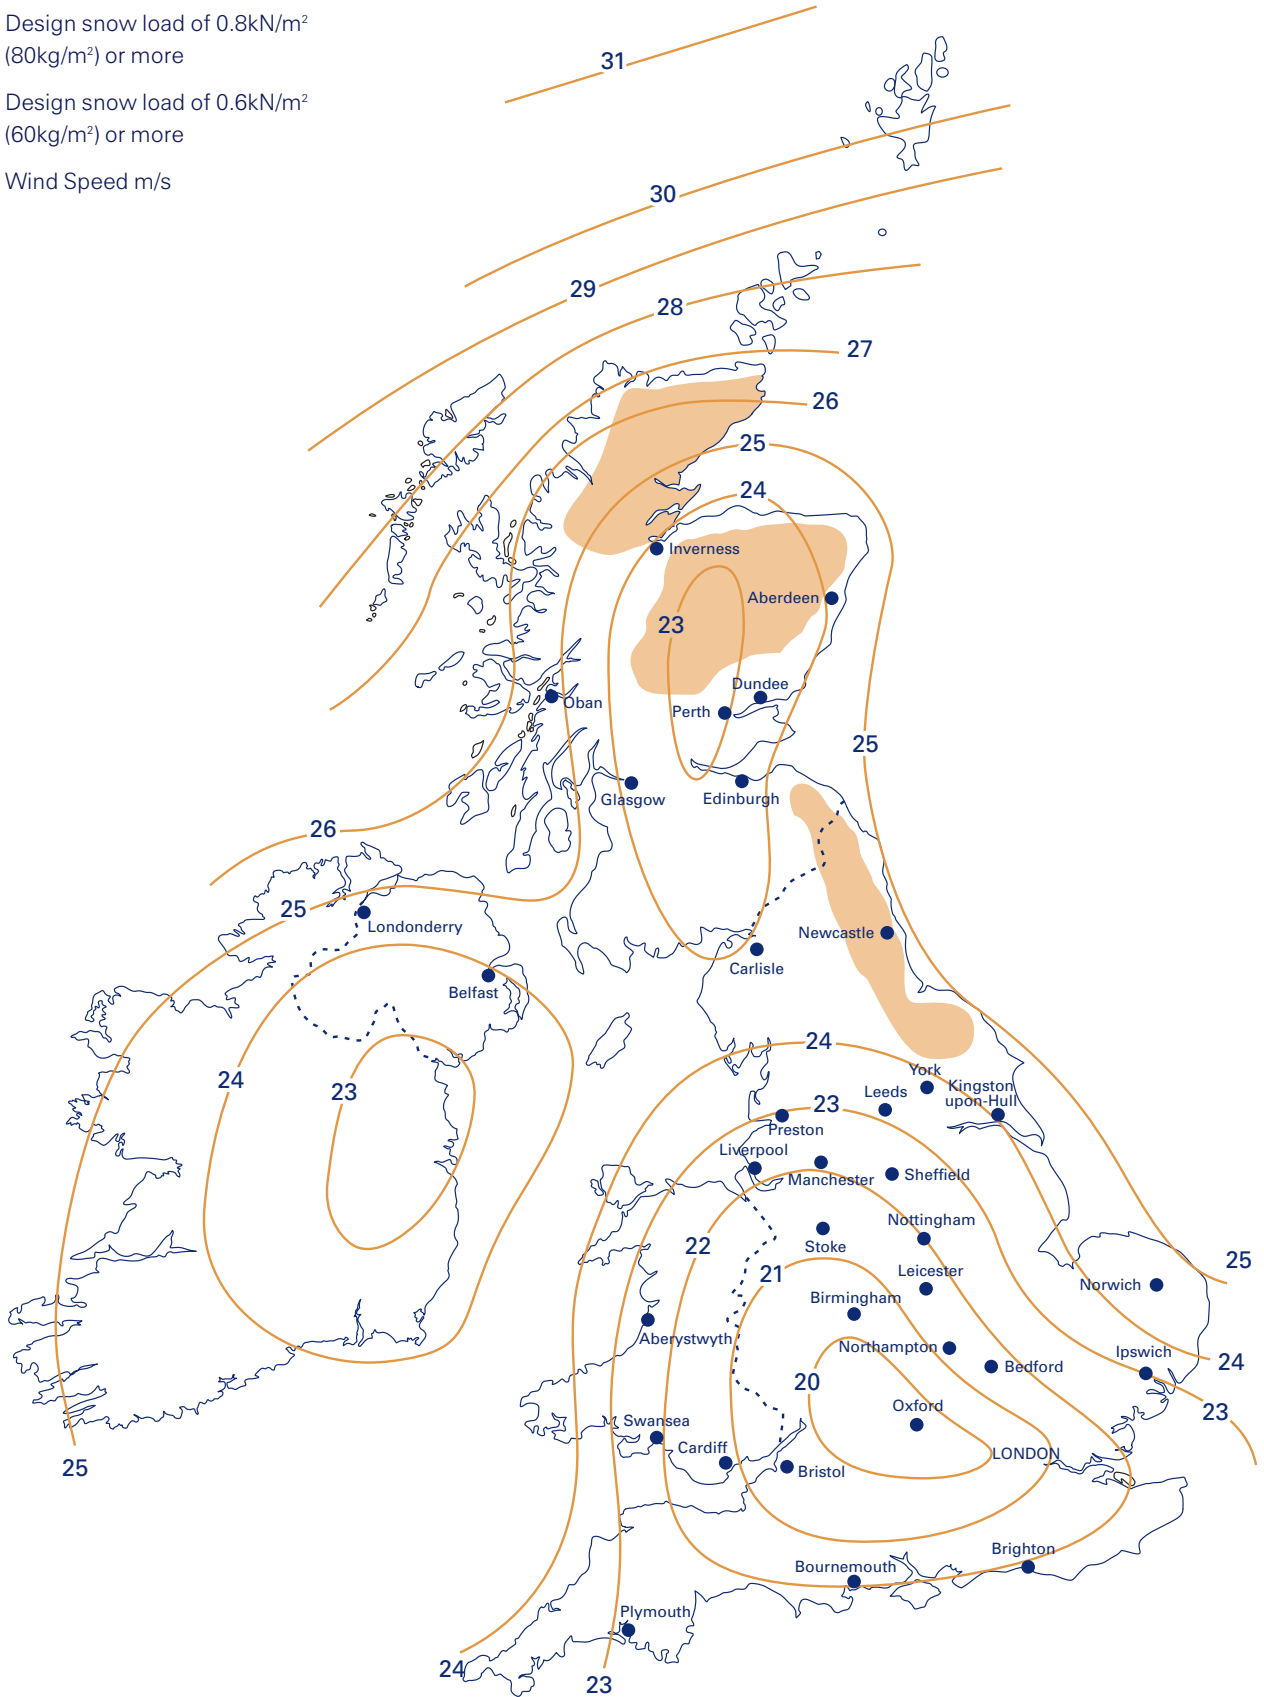

### GABLE

	MAXIMUM WIDTH	MAXIMUM PROJECTION
<b>Glass</b>	5750mm	6500mm
<b>Polycarbonate</b>	6500mm	6500mm

If the roof size is outside these sizes please contact the K2 Technical Department for advice. Telephone 01204 554 554.

- Design snow load of 0.8kN/m<sup>2</sup> (80kg/m<sup>2</sup>) or more
- Design snow load of 0.6kN/m<sup>2</sup> (60kg/m<sup>2</sup>) or more
- Wind Speed m/s

## SNOW LOADING

STRUCTURAL GUIDE

### Snow Altitude Factor

For conservatory installations less than 100m above sea level the 0.6kN/m<sup>2</sup> and 0.8kN/m<sup>2</sup> snow regions indicated on the map (page 5) can be utilised.

For installations at altitudes greater than 100m and less than 223m above sea level within the 0.6kN/m<sup>2</sup> of the map the 0.8kN/m<sup>2</sup> table can be used.

For installations at altitudes greater than 223m within the 0.6kN/m<sup>2</sup> and greater than 100m in the 0.8kN/m<sup>2</sup> region, guidance should be sought from the K2 Technical Department.

If in doubt about the altitude of a particular installation refer to local Ordnance Survey map.

### Dominant Wind Load Basic Speeds

0.6kN/m<sup>2</sup> Snow Load on a Polycarbonate Roof in the Country

### Dominant Wind Speed Table

Multiplication Factors

0.8kN/m <sup>2</sup> snow load roofs	1.16
Location in city/town (town extending >2m upwind from site)	1.11
4-16-4mm double glazed units	1.03
6-16-6mm double glazed units	1.06

Please contact the K2 Technical Department if the site is subject to the following categories:

- Where dominant forces wind speeds are greater than those from the illustrated map (page 5) for the area in question.
- Locations near the summit of a hill, crest of a cliff, escarpments or ridges.
- For conservatories of overall height greater than 3.5m.

# VICTORIAN/GEORGIAN TRANSOM SPAN CHART

STRUCTURAL GUIDE

## POLYCARBONATE

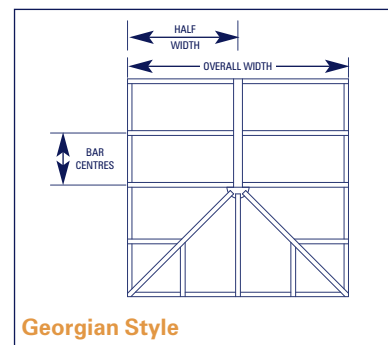

### Example Calculation

Half width multiplied by slope factor table below equals effective span.

Example: 5000mm overall width gives 2500mm half width. 2500mm multiplied by 1.104 (30 degrees) equals 2760mm effective span.

### Slope Calculation Factor

Slope Angle (degrees)	20	25	30	35
Span Multiplication Factor	1.044	1.070	1.104	1.148

- 1** : 25mm Heavy Duty Bar/35mm Aspire
- 2** : 16mm Heavy Duty Bar
- 3** : 25mm Standard Bar
- 4** : 16mm Standard Bar

Please note that overall sizes of the required roof design must not exceed those stated in section 1.

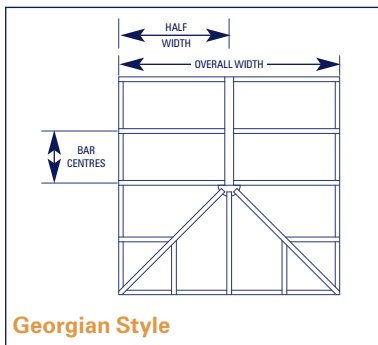

- 1** : 25mm Heavy Duty Bar/35mm Aspire
- 2** : 16mm Heavy Duty Bar
- 3** : 25mm Standard Bar
- 4** : 16mm Standard Bar

# VICTORIAN/GEORGIAN TRANSOM SPAN CHART

STRUCTURAL GUIDE

- 1** : 25mm Heavy Duty Bar
- 2** : 25mm Standard Bar

Please note that overall sizes of the roof design must not exceed those stated in section 1.

- 1** : 25mm Heavy Duty Bar
- 2** : 25mm Standard Bar

## DOUBLE GLAZED UNITS (4:16:4mm)

### Example Calculation

Half width multiplied by slope factor table below equals effective span.

**Example:** 5000mm overall width gives 2500mm half width. 2500mm multiplied by 1.104 (30 degrees) equals 2760mm effective span.

Slope Calculation Factor				
Slope Angle (degrees)	20	25	30	35

- 2** : 25mm Heavy Duty Bar
- 3** : 25mm Standard Bar

**DOUBLE GLAZED UNITS (4:16:4mm)**

Projection and half width on plan should be taken to calculate the correct Georgian hip bar to be used on the roof. The transom glazing bars can be either jack rafters or splayed.

Please note that overall sizes of the roof design must not exceed those stated in section 1.

# GEORGIAN HIP SPAN CHART

STRUCTURAL GUIDE

## DOUBLE GLAZED UNITS (4:14:6.4mm)

Projection and half width on plan should be taken to calculate the correct Georgian hip bar to be used on the roof. The transom glazing bars can be either jack rafters or splayed.

Please note that overall sizes of the roof design must not exceed those stated in section 1.

- 1** : 25mm Heavy Duty Bar With Bolster
- 2** : 25mm Heavy Duty Bar
- 3** : 25mm Standard Bar

- 1** : 25mm Heavy Duty Bar with Bolster
- 2** : 25mm Heavy Duty Bar
- 3** : 25mm Standard Bar

**Tie Bar Rules**

- When a tie bar is required it must be installed in line with the pair of glazing bars closest to the end of the ridge. (Max distance from end of ridge 750mm.)
- When multiple tie bars are required, the first one is to be positioned as described above with the remaining bars positioned at equal intervals between the first tie bar and the wall.
- For advice on sizes outside the following charts contact the K2 Technical Department.
- Special rules apply to free-standing and double ended conservatories. Contact the K2 Technical Department for advice.
- On the following tables it is assumed that the conservatories are attached to the house wall at the rear and that the roof pitches are equal on all sides.
- The following tables are relevant to areas with a maximum snow load of 0.8 kN/m<sup>2</sup>.

**How the Tie Bar Works**

Tie bars are a mechanism used to laterally restrain movement in opposing eaves beams. By securing a tie bar between two eaves beams, the spread effect created by loads placed on the roof (wind, snow, glass etc.) is prevented.

**Victorian**

These tie bar tables can be used for either 3 or 5 bay victorian roofs.

The tables have been based on the roof having the same pitch on all sides.

	4751-5250	0	0	1	1	2	2	2	2
	5251-5750	0	0	1	1	1	2	2	2
	5751-6250	0	0	1	1	1	2	2	2

## Gable

The following have been based on the roofs having equal pitch on both sides and with one gable end attached to the building.

When gable roofs are built with a continuous eaves beam, tie bars must be equally spaced along the ridge.

In cases where the eaves beam is non-continuous, the first tie bar must be positioned under the first set of glazing bars behind the gable frame.

In all cases the maximum distance between sets of bars must not exceed 2400mm.

**Double Ended Ridges/Hipped Back Roofs**

When one set of tie bars is required, it should be positioned centrally along the ridge.

If two or more sets are required, two should be positioned as close to the finial points as possible .

For roofs outside of these parameters please contact the K2 Technical Department for advice.

**P-Shaped Conservatories**

1. Victorian and Georgian roofs greater than 3000mm in width require a tie bar.
2. If possible the tie bar should be positioned in line with the front edge of the lean to section. If this is not possible the tie bar can be positioned up to a maximum of 1/4 way up the valley.
3. If possible the finial point of the main ridge should be in line with the front edge of the lean to section or beyond it.
4. Under no circumstances should bolster bars be fitted on roof designs incorporating valleys.
5. Tie bars must be positioned beneath glazing bars.
